**First: Water treatment products from  
Jamestown Chemical**

**For 40 years Jamestown has been providing practical and proficient water treatment programs used by industrial, commercial and institutional facilities. The company has a successful history of innovative products and services that address many of the most demanding environmental and performance concerns. Four decades later, it continues to be a resource of quality products, proven treatment programs and uncompromised customer support.**

The vision began in 1972 with the introduction of a comprehensive molybdate-based cooling water treatment program for corrosion and deposit control. Jamestown's Molygard® replaced environmentally-toxic and carcinogenic chromates, and less effective phosphate-based treatments. Forty years later it remains a preferred technology.

By establishing interactive and trusted partnerships with customers, Jamestown has dynamically developed products and treatments that have benefited their customers and the entire water treatment industry. Jamestown has always supported its products by guiding and advising the implementation of site-specific, analytically formulated, comprehensive treatment programs that work within existing operations. This includes chemical and engineering considerations, conformity to legislative regulations, equipment adjustments, recommended training, and thorough cost evaluations based on practical workable solutions.

Jamestown is a U.S. based company that has decades of experience in dealing with the needs of a diverse customer base that includes commercial, educational, medical, governmental and manufacturing facilities. Heavy industries such as refineries, power stations, mineral miners, and metals producers have also relied on a broad range of proven technologies that continued to expand the company's capabilities well beyond simple "just-add" chemical solutions.

# Providing 40 years of water treatments solutions

More recently, Jamestown has helped develop a series of safer, easier to use solid concentrates designed to replace conventional bulky and leak-prone drums filled with liquid-based chemicals. Use of Solid Solutions® products for cooling and boiler water treatments also provide facilities with LEED credits for reduced chemical consumption, water conservation and lower carbon footprints.

Jamestown's products address a broad range of in-line treatment methods including:

- Volatile oxygen-scavengers, anti-foam agents, iron-dispersants and USDA/FDA approved one-drum boiler water treatments. Also, for wastewater programs there are products that remove heavy metals, suspended solids and hydrocarbons, as well as media to remove specific ions.
- SSI® (Sulfate Solubility Inhibitor) to prevent calcium sulfate from dissolving during the brine production process.
- Start-up, on-line cleaning and wet and dry layup programs for cooling and boiler systems.
- Fuel Oil Additives and performance enhancing combustion catalysts that promote complete carbon burn-out.

Jamestown Technologies is a division of Azure Water Services LLC. Other affiliates include:

- Water Solutions™ – a leading provider of chlorine dioxide-based technologies used in disinfections, metal removal, food processing, oil and gas recovery (fracturing), and odor control processes in municipal and industrial marketplaces. Water Solutions also provides a wide variety of products used to control corrosion and deposition problems in potable water systems.
- Redux Technology™ – a respected innovator and marketer of products and services used in the hazardous waste site and groundwater remediation industries.

**Forty years later, facing ever-increasing demands for efficient use of water, Jamestown customers continue to inspire us to use our decades of experience to create new and innovative products, processes, and services that provide them clear solutions to their water treatment concerns.**

A DIVISION OF AZURE WATER SERVICES, LLC

**Jamestown now offers a complete line of supplemental cleaning and maintenance programs for cooling and boiler water systems. This can help keep your equipment operating at peak efficiency levels throughout its entire expected service life, saving you money in terms of utility expenses and replacement costs.**

**Today, Jamestown is developing new technologies that better address the detection and control of Legionella bacteria and other troublesome microorganisms in critical water handling systems, including cooling towers, potable outlets and decorative fountains.**
